# Introduction to Robotics

### Lecture 4

Kacper Jastrzębski 260607@student.pwr.edu.pl

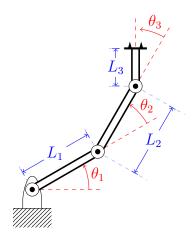

Date: Tuesday 11:15, 21-3-2023

### Contents

1 Forward kinematics				
2	Denavit-Hartenberg (1955) solution	2		
	2.1 Preliminary assumptions	2		
	2.2 Algorithm:	2		
3	Planar double pendulum	3		

#### 1 Forward kinematics

Let's recapitulate the naming conventions for a exemplary manipulator:

### 2 Denavit-Hartenberg (1955) solution

Jacques Denavit and Richard Hartenberg introduced this convention in 1955 in order to standardize the coordinate frames for spatial linkages<sup>1</sup>. They came up with an universal algorithm for describing the motion (or in other words: attaching a reference frames to the links) of a manipulator.

#### 2.1 Preliminary assumptions

- 1. motion allowed only along z-axis
- 2. rigid body assumed

#### 2.2 Algorithm:

- 1. Step: assign axes of rotation  $z_0 \dots z_{n-1}$
- 2. Step: describe base frame  $O_0x_0y_0z_0^2$
- 3. Step: create a loop  $i = 1, \ldots, n-1$  (repeat steps 4-6)
- 4. Step: determine  $O_i$  (the origin of next frame), consider 3 cases:
  - (a) case:  $O_i = z_{i-1} \cap z_i$
  - (b) case parallel: a point where normal line passing through  $O_{i0-1}$  crosses  $Z_i$
  - (c) case: a point where normal line to both  $Z_{i-1}$  and  $Z_i$  crosses  $Z_i$
- 5. Step: determine  $x_i$  axis, for each case:
  - (a)  $x_i = z_{i-1} \times Z_i$
  - (b) b and c:  $x_i$  along normal line selected previously
- 6. Step: calculate missing axis  $y_i$  such the  $x_iy_iz_i$  is a right-handed frame
- 7. Step: end-effector frame:
  - (a) origin  $O_n$  between fingers of a grabbing, two fingered effector
  - (b)  $z_n \mid\mid z_{n-1}$  inherited from the last joint
  - (c)  $y_n$  finger motion direction

<sup>&</sup>lt;sup>1</sup>Description borrowed from Wikipedia: Denavit–Hartenberg parameters.

<sup>&</sup>lt;sup>2</sup>Axis should be chosen wisely, in respect to the surroundings, context, and the use case.

(d)  $x_n \to x_n y_n z_n \to \text{right-handed}$ 

8. Step: determine D-H parameters described in table below:

	$\theta_i$	$d_i$	$a_i$	$\alpha_i$
1	$ heta_1$	$d_1$	$a_1$	$\alpha_1$
2	$\theta_2$	$d_2$	$a_2$	$\alpha_2$
:				
n	$\theta_n$	$d_n$	$a_n$	$\alpha_n$

This is the procedure that is using th D-H parameters

$$A_{i-1}^{i}(q_i) = Rot(z, \theta_i) Tran(z, d_i) Tran(x, a_i) Rot(x, \alpha_i)$$
(1)

9. Describe full kinematic:

$$A_0^n(q) = A_0^1(q1) \cdot A_1^2(q2) \cdots A_{n-1}^n(q_n)$$
(2)

note-1 with pictures

## 3 Planar double pendulum

Simple but not trivial example of a system: notes-2

	$\theta_i$	$d_i$	$a_i$	$\alpha_i$
1	$q_1$	0	$a_1$	0
2	$q_2$	0	$a_2$	0

$$q = \begin{bmatrix} q1\\q2 \end{bmatrix} \tag{3}$$

$$A_0^2(q) = A_0^1(q_1) \cdot A_1^2(q_2) \tag{4}$$

$$Rot(z,q_1) \cdot Tran(x,a_1) = \begin{bmatrix} c_1 & -s_1 & 0 & 0 \\ s_1 & c_1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 1 & 0 \end{bmatrix} = (5)$$
